

Corn

# Corn

## **Corn:**

For a successful crop, plant sweet corn only when the soil has warmed to at least 18°C.

## **Planting:**

To ensure proper pollination, plant at least 3 to 4 rows. When planting in rows, space seeds 10-15 cm apart, later thinning to 20-30 cm apart. Rows should be spaced 55-75 cm apart. Alternatively, corn can be planted with 3 to 4 seeds per hill, in hills spaced 30 cm apart. Germination occurs in approximately 10 days.

## **Care:**

Work a good general vegetable fertilizer into the soil at planting, keep weeds under control, and ensure the soil is evenly watered throughout the season.
